1 Introduction

The `sos4R` package provides classes and methods for retrieving data from an OGC Sensor Observation Service (Na, 2007). The goal of this package is to provide easy access with a low entry threshold for everyone to information available via SOSs. The complexity of the service interface shall be shielded from the user as much as possible, while still leaving enough possiblities for advanced users. At the current state, the output is limited to a standard data.frame with attributed columns for metadata. In future releases a tighter integration is planned with upcoming space-time packages regarding data structures and classes. This package uses S4 classes and methods style (Chambers, 1998).

The motivation to write this package was born out of perceiving a missing link between the Sensor Web community (known as Sensor Web Enablement (SWE) Initiative[1] in the OGC realm) and the community of (geo-)statisticians. While the relatively young SWE standards get adopted more by data owners (like governmental organizations), we see a high but unused potential for more open data and spatio-temporal analyses based on it. `sos4R` can help enabling this.

The project is part of the geostatistics community[2] of the 52 °North Initiative for Geospatial Open Source Software[3]. `sos4R` is available, or will be available soon, on CRAN.

On the package home page, `http://www.nordholmen.net/sos4r/`, you can stay updated with the development blog, find example code and services, and download source packages.

This software is released under a GPL 2 license[4] and contributions are very welcome. Please consult section 10 for details.

The package `sos4R` is loaded by

```
> library("sos4R")
```

This document was build for **package version**

```
0.1-08
```

Related Specifications

The Open Geospatial Consortium[5] (OGC) is an organisation which provides standards for handling geospatial data on the internet, thereby ensuring interoperability.

The Sensor Observation Service (SOS) is such a standard and provides a well-defined interface for data warehousing of measurements and observations made by all kinds of sensors. This vignette describes the classes, methods and functions provided by `sos4R` to query these observations.

Storing and providing data in web services is more powerful than local file copies (with issues like outdating, redundancy, ...). Flexible filtering of data on the service side reduces download size. That is why SOS operations can comprise flexible subsetting in temporal, spatial and thematical domain. For example "Provide only measurements from sensor MySensor-001 for the time period from 01/12/2010 to 31/12/2010 where the air temperature below zero degrees".

In general, the SOS supports two methods of requesting data, HTTP GET and POST, but always returns eXtensible Markup Language (XML) documents.

Standards that are referenced respectively used by SOS are as follows.

Observations and Measurements (O&M) O&M () defines the markup of sensor measurements results. An observation consists of information about the observerd geographic feature, the time of observation, the sensor, the observed phenomenon, and the observation's actual result.

Sensor Model Language (SensorML) SensorML () is used for sensor metadata descriptions (calibration information, inputs and outputs, maintainer).

Geography Markup Language (GML) () ...

SweCommon SWE Common () describes data markup.

Filter Encoding Filter Encoding () defines operators and operands for filtering values.

OWS Common OGC Web Services Common (Whiteside, 2007) models service related elements that are reusable across several service specifications, like excheption handling.

Terms and Definitions

The OGC has a particular set of well-defined terms that might differ from usage of words in specific domains. The most important are as follows[6].

Feature of Interest (FOI) The FOI represents the geo-object, for which measurements are made by sensors. It is ordinarily used for the spatial referencing of measuring points, i.e. the geoobject has coordinates like latitude, longitude and height. The feature is project specific and can be anything from a point (e.g. the position of a measuring station) or a real-world object (e.g. the region that is observed).

Observation The observation delivers a measurement (result) for a property (phenomenon) of an observed object (FOI). The actual value is created by a sensor or procedure. The phenomenon was measured at a specific time (sampling time) and the value was generated at a specific point in time (result time). These often coincide so in practice the sampling time is often used as the point in time of an obsrevation.

[6]Based on http://de.wikipedia.org/wiki/Sensor_Observation_Service

Offering The offering is a logical collection of related observations (similar to a layer in mapping applications) which a service offers together.

Phenomenon A phenomenon is a property (physical value) of a geographical object, e.g. air temperature, wind speed, concentration of a pollutant in the athmosephere, reflected radiation in a specific frequency band (colours).

Procedure A procedure creates the measurement value of an observation. The source can be a reading from a sensor, simulation or a numerical process.

A more extensive discussion is available in the the O&M specification (Cox, 2007). The Annex B of that document shows the following examples of applicating some terms to a specific domain, earth observations, which are repeated here for elaboration.

O&M	Particulate Matter 2.5 Concentrations	E
Observation::result	35 ug/m3	observation value, measurement valu
Observation::procedure	U.S. EPA Federal Reference Method for PM 2.5	method, senso
Observation::observedProperty	Particulate Matter 2.5	parameter, variab
Observation::featureOfInterest	troposphere	media (air, water, ...), Global Change Master Directory "Topi

2 Supported Features

The package provides accessor functions for the supported parameters. It is recommended to access options from the lists returned by these functions instead of hardcoding them into scripts.

```
> SosSupportedOperations()

[1] "GetCapabilities"    "DescribeSensor"     "GetObservation"
[4] "GetObservationById"

> SosSupportedServiceVersions()

[1] "1.0.0"

```

3 Default Options

Two kinds of default values can be found in (function calls in) `sos4R`: (i) default depending on other function parameters, and (ii) global defaults. Global defaults can be inspected (not set!) using the following functions. If you want to use a different value please adapt the respective argument in function calls.

```
> SosDefaultConnectionMethod()
```

```
[1] "POST"
```

```
> SosDefaults()
```

```
$sosDefaultCharacterEncoding
[1] "UTF-8"

[59] "mg"                               "uom"
[61] "urn:ogc:data:feature"
```

4 Creating a SOS connection

To create a SOS connection you only need the URL of the service. The operations prints out a short statement when the connection was successful.

```
> mySOS = SOS(url = "http://v-swe.uni-muenster.de:8080/WeatherSOS/sos")

Created SOS for URL http://v-swe.uni-muenster.de:8080/WeatherSOS/sos
```

options...

```
> sosUrl(mySOS)

[1] "http://v-swe.uni-muenster.de:8080/WeatherSOS/sos"

> sosVersion(mySOS)

[1] "1.0.0"

> sosTimeFormat(mySOS)

[1] "%Y-%m-%dT%H:%M:%OS"

> sosMethod(mySOS)

[1] "POST"
```

The default connection method is HTTP POST, but since not all SOS support this a GET connection is possible was well (though limited regarding the filtering operations). Section 6.3 contains an example of such a connection.

5 SOS Operations

sos4R supports the core profile of version 1.0.0 of the specification comprising the operations GetCapabilities, DescribeSensor and GetObservation. This document focusses on the practical usage of the operations, so the reader is refered to the specification document for details.

5.1 GetCapabilities

The GetCapabilities operations is automatically conducted during the connecting to a SOS instance. If you want to inspect the original capabilities document it can be re-requested using

```
> sosCapabilitiesDocumentOriginal(sos = mySOS)
```

The actual operation can be started with the following function. It returns an object of class SosCapabilities which can be accessed later on by the function sosCaps() from an object of class SOS.

```
> getCapabilities(sos = mySOS)
```

options...

5.2 Metadata Extraction for Request Building

How can one extract the metadata from a SOS connection and reuse it for queries?

accessor functions, elements of the capabilities, ...

```
> sosContents(mySOS)

Object of class SosContents with observation offerings (names):  RAIN_GAUGE, LUMINANCE, HU

> sosFilter_Capabilities(mySOS)

Object of class SosFilter_Capabilities;
        Spatial_Capabilities:         gml:Envelope, gml:Point, gml:LineString, gml:Polygon
        Temporal_Capablities:         gml:TimePeriod, gml:TimeInstant ;
        Scalar_Capablities:                 Between, EqualTo, NotEqualTo, LessThan, LessTh
        Id_Capabilities                         FID, EID

> sosServiceIdentification(mySOS)

Object of class OwsServiceIdentification:
        ServiceType:  OGC:SOS ; serviceTypeVersion(s):  1.0.0
        title(s):  IFGI WeatherSOS
        Profile(s):
        Abstract(s):  SOS for weather observations at IFGI, Muenster, Germany (SVN: 9075 @
        Keywords(s):  , temperature, humidity, wind speed, luminance, wind, wind direction
        AccessConstraints(s):  WeatherSOS data is made available under the Open Data Commo

> sosServiceProvider(mySOS)
```

```
Object of class OwsServiceProvider:

5.3 DescribeSensor

The DescribeSensor operation is specified in clause 8.3 of the SOS specification and their response is modeled in Sensor Model Language[8] (SensorML) and Transducer Markup Language[9] (TML) specifications.

> The DescribeSensor operation is useful for obtaining detailed information of sensor characteristics encoded in either SensorML or TML. The sensor characteristics can include lists and definitions of observables supported by the sensor. [...]

```
> describeSensor(mySOS, sosProcedures(off.temp)[[2]])
```

```
Object of class SensorML (wraps unparsed XML, see @xml for details).
```

5.4 GetObservation

5.4.1 Basic Request

```
> getObservation(sos = mySOS, ...)
```

[8] http://www.opengeospatial.org/standards/sensorml
[9] http://www.opengeospatial.org/standards/tml

The returned data is a XML document of type OmObservation, OmMeasurement, or OmObservationCollection which holds a list of the former two and is the usual case.

```
> length(obs.temp.latest)
> obs.temp.latest[[1]]
> obs.temp.latest[2:5]
> sosCoordinates(obs.temp.latest)
> sosCoordinates(obs.temp.latest[[1]])
> sosFeatureIds(obs.temp.latest)
> sosBoundedBy(obs.temp.latest)
```

show/explain conversion to zoo, sp?

```
> sosResult(obs.temp.latest[[2]])
> obs.temp.latest.result <- sosResult(obs.temp.latest[1:2])
> attributes(obs.temp.latest.result[["urn:ogc:def:property:OGC::Temperature"]])
> obs.temp.latest.coords <- sosCoordinates(obs.temp.latest)
> obs.temp.latest.data <- merge(x = obs.temp.latest.result, y = obs.temp.latest.coords)
> obs.temp.latest.data
```

5.4.2 Temporal Filtering

```
> lastWeek <- sosCreateEventTimeList(sosCreateTimePeriod(sos = mySOS,
+     begin = (Sys.time() - 3600 * 24 * 7), end = Sys.time()))
```

5.4.3 Spatial Filtering

5.4.4 Feature Filtering

5.4.5 Value Filtering

Value Filtering is realized via the slot `result` in a GetObservation request. The filtering in the request is based on comparison operators and operands specified by OGC Filter Encoding (Vretanos, 2005).

The classes and methods of this specification are not yet implemented, but manual definition of the XML elements is possible with the methods of the **XML** package.

The following code example uses a literal comparison of a property:

```
> filter.value <- -2.3
> filter.propertyname <- xmlNode(name = ogcPropertyNameName, namespace = ogcNamespacePrefi
> xmlValue(filter.propertyname) <- "urn:ogc:def:property:OGC::Temperature"
> filter.literal <- xmlNode(name = "Literal", namespace = ogcNamespacePrefix)
> xmlValue(filter.literal) <- as.character(filter.value)
> filter.comparisonop <- xmlNode(name = ogcComparisonOpGreaterThanName,
+     namespace = ogcNamespacePrefix, .children = list(filter.propertyname,
+         filter.literal))
> filter.result <- xmlNode(name = sosResultName, namespace = sosNamespacePrefix,
+     .children = list(filter.comparisonop))
```

Please consult to the extensive documentation of the **XML** package for details. The commands above result in the following output which is inserted into the request without further processing.

```
> print(filter.result)

<sos:result>
 <ogc:PropertyIsGreaterThan>
  <ogc:PropertyName>urn:ogc:def:property:OGC::Temperature</ogc:PropertyName>
  <ogc:Literal>-2.3</ogc:Literal>
 </ogc:PropertyIsGreaterThan>
</sos:result>
NULL
```

The object of class `OgcComparisonOpsOrXMLOrNULL` can be used in the GetObservation request.

```
> lastWeek.obs <- getObservation(sos = mySOS, eventTime = lastWeek,
+     offering = sosOfferings(mySOS)[["ATMOSPHERIC_TEMPERATURE"]])

Finished getObservation to http://v-swe.uni-muenster.de:8080/WeatherSOS/sos - received 1 o
Object of class OmObservationCollection with 1 members.

> lastWeek.obs.filt <- getObservation(sos = mySOS, eventTime = lastWeek,
+     offering = sosOfferings(mySOS)[["ATMOSPHERIC_TEMPERATURE"]],
+     result = filter.result)

Finished getObservation to http://v-swe.uni-muenster.de:8080/WeatherSOS/sos - received 1 o
Object of class OmObservationCollection with 1 members.

> print(paste("Filtered:", dim(sosResult(lastWeek.obs.filt))[[1]],
+     "-vs.- Unfiltered:", dim(sosResult(lastWeek.obs))[[1]]))

[1] "Filtered: 131 -vs.- Unfiltered: 569"
[1] "Filtered: 131 -vs.- Unfiltered: 569"
```

5.4.6 Result Exporting

5.5 GetObservationById

The operation GetObservationById is defined in clause 10.1 of the SOS specification and not part of the core profile. But it is implemented as it is quite simple. The response is the same as described in the previous section. Optional parameters are the same as in GetObservation requests.

```
> getObservationById(sos = mySOS, observationId = "o001")
```

6 Changing Handling Functions

TODO: explain approach, mention available non-exchangeable functions in the subsections

fixed order, exchangeable components

6.1 Parsing/Decoding

TBD

6.2 Encoding

TBD

6.3 Data Converters

7 Exception Handling

8 Getting Started

The demos are a good way to get started with the package. Please be aware that the used SOSs might be unavailable temporarily.

```
> demo(package = "sos4R")
```

Additionally, there is a list of services on the project homepage (http://www.nordholmen.net/sos4r/data/) and a few SOS URLs are available via the function `SosExampleServices()`.

```
> SosExampleServices()

$`52 North SOS: Weather Data, station at IFGI, Muenster, Germany`

```

9 Getting Support

If you want to ask questions about using the software, please go first to the 52°North forum for the geostatistics community at http://geostatistics.forum.52north.org/ and check if a solution is described there. If you are a frequent user please consider subscribing to the geostatistics mailing list (http://list.52north.org/mailman/listinfo/geostatistics) which is linked to the forum.

10 Developing sos4R

Code Repository

You can download and browse the source of the sos4R package directly from the 52 °North repository:

- **SVN resource URL**: https://svn.52north.org/svn/geostatistics/main/sos4R. Please read the documentation of 52N repositories[10]. Anonymous access for download is possible.
- **Web access**: https://svn.52north.org/cgi-bin/viewvc.cgi/main/sos4R/?root=geostatistics

See the **developer documentation** at the 52 °North Wiki for detailed information on how to use the checked out source project: https://wiki.52north.org/bin/view/Geostatistics/Sos4R. You will find a detailed description of the folder and class structure, the file naming scheme, and an extensive list of tasks for future development.

Please get in touch with the community lead[11] of the geostatistics community if you want to **become a contributor**.

11 Acknowledgements

The project was generously supported by the 52 °North Student Innovation Prize for Geoinformatics 2010.
